

One Mind, **One World.**

OM World Litepaper v0.1 — a Genesis Draft for a decentralized intent economy where AI executes and crypto verifies. Public review encouraged. Not financial, legal, or token-issuance advice.

• FIRST PRINCIPLES

AI is the engine.
Crypto is the law.
Humanity owns its
intentions.

DEFINITION • V0.1

OM World is a decentralized intent economy protocol for expressing, executing, verifying, and settling human intentions — a substrate where AI agents act under cryptographic mandate, every consequential action leaves a proof, and the originator of an intent remains its sovereign.

Contents

Sixteen sections, ten figures, one Genesis draft. Read in order or jump to any chapter — every page is annotated.

§ 01 · THE THESIS, IN ONE PAGE

Abstract.

AI should execute human intention. It should not own it. Crypto should verify execution. It should not replace human agency.

01 / ABSTRACT

OM World, in 200 words.

READ TIME
~ 2 MIN

— SUMMARY —

A protocol for the intent economy.

DOMAIN om.world
STACK intent • agent • tool •
compute • proof •
settlement •
governance
NATURE open • public •
evolving

OM World is a decentralized intent economy protocol. It enables human intentions to be expressed, transformed into executable actions by AI agents, verified through cryptographic mechanisms, and settled through open economic rules.

Where the previous era of the internet auctioned attention, the next era will route intent. If that routing happens inside closed AI platforms, user intentions become proprietary assets, agent decisions are shaped by hidden incentives, and verification depends on institutional trust rather than open proof.

OM World proposes a decentralized alternative: a stack for intent expression, agent mandates, tool registries, execution proofs, settlement, reputation, and governance. Its long-term goal is an open digital world where anyone can declare an intention, invoke tools to fulfill it, verify the result, and participate in the value the intent creates.

AI should execute human intention — but not **own** it.
Crypto should verify execution — but not **replace** agency.

S 02 · THE END OF THE ATTENTION ECONOMY

Background.

For two decades the internet has auctioned clicks. Models change the substrate. The next economic layer routes intent — and the question of who owns that layer is the next question of digital sovereignty.

02 / BACKGROUND

From the attention economy to the intent economy.

FIG. 1
ECONOMIC
SHIFT

Search engines, social platforms, marketplaces, and advertising networks compete to capture and monetize human attention. The user is the product; the click is the unit of account.

AI changes the primary unit of interaction. Users no longer want to issue queries — they want to declare outcomes. Goals replace keywords. Outcomes replace impressions. Mandates replace clicks.

This creates a new economic layer: **the intent economy**. Value is produced when a human intention is understood, routed, executed, verified, and settled. But if this layer is captured by centralized AI platforms, several risks emerge — user intents become proprietary assets; sponsored execution paths displace user-aligned outcomes; consent decays into hidden defaults; tool creators and compute providers are locked inside closed gardens; and verification rests on brand reputation, not on open proof.

OM World proposes a decentralized alternative: a protocol where intentions are first-class objects, every action is bound to an explicit mandate, and every consequential outcome carries a proof a third party can independently check.

§ 03 · WHAT WE ARE BUILDING

Vision.

AI is the **engine**.

Crypto is the **law**.

Humanity owns its **intentions**.

03 / VISION

Three principles. One protocol.

FIG. 2
PILLARS

OM World rests on three commitments. None of them is novel on its own — together, they form a contract between users, agents, and the world they act in.

— PRINCIPLE I —

AI Is the Engine.

AI provides the reasoning, planning, generation, coordination, and execution capacity required to fulfill complex human intentions. It is power, not purpose. It serves the originator of the intent — never the other way around.

— PRINCIPLE II —

Crypto Is the Law.

Cryptography, smart contracts, signatures, hashes, attestations, staking, and settlement rules provide the verifiable structure required for an open intent economy. Rules are written in code, enforced in math, and visible to all who care to check.

— PRINCIPLE III —

Humanity Owns Its Intentions.

The user, organization, or community that declares an intention remains the sovereign originator of that intention. Intentions are expressible, executable, verifiable, composable, auditable, economically meaningful — and user-owned.

§ 04 · WORDS WE AGREE TO SHARE

Core Concepts.

Eight terms describe everything in OM World. Get these right and the rest of the document — architecture, lifecycle, settlement — reads as natural consequence.

04 / CORE CONCEPTS

Glossary.

TERMS 01 — 08
STABLE FOR V0.1

01

Intent

A structured expression of a desired outcome. Begins in natural language; resolves into an object containing constraints, permissions, budget, risk preferences, allowed tools, verification requirements, and settlement rules.

02

Intent Originator

The person, organization, wallet, DAO, or system that declares an intent. The originator owns the intent and defines the initial mandate. Sovereignty over an intent never silently transfers.

03

Agent

An AI-powered executor that transforms an intent into a plan and performs actions through available tools. Agents do not own intents. Agents act strictly under mandate.

04

Mandate

The explicit, signed authorization granted by the originator. Defines what an agent or tool may do, under what constraints, with what budget, for what purpose, within what time window.

05

Tool

A registered capability that can help fulfill an intent — search, trading, payment, data, code, audit, content, procurement, research, scheduling, verification. Tools are composable. Tools can be invoked by any agent under a valid mandate.

06

Execution Proof

Evidence that a declared action or outcome occurred. May include transaction hashes, signed logs, tool output hashes, verifier attestations, zero-knowledge proofs, oracle attestations, or reproducible result records.

07

Settlement

The act that finalizes economic consequence: user payment, tool revenue, agent fees, compute rewards, verifier rewards, capital returns, refunds, slashing, dispute outcomes, and reputation updates.

08

Intent Ledger

The record of declared intents, mandates, execution traces, proofs, settlements, and reputation events. Sensitive data stays encrypted, hashed, or off-chain; proofs and commitments remain verifiable by anyone.

§ 05 · A PROTOCOL STACK, NOT A PRODUCT

Protocol Architecture.

OM World is best understood as a seven-layer stack. Each layer is independently composable, independently governed, and built from open specifications.

05 / PROTOCOL ARCHITECTURE

Seven layers.

FIG. 3
PROTOCOL STACK

The top layer is human intention. The bottom layer is protocol governance. Between them, agents interpret, tools execute, compute powers, and proof records everything that matters. Gold marks where human intent originates; cyan marks where verification proves.

L1	Intent Layer ORIGINATION • CONSENT	natural-language input • intent parser • schema • constraints • consent config • signing • intent hash	
L2	Agent Layer REASONING • ROUTING	planner • tool selector • execution router • risk evaluator • policy checker • mandate interpreter • action logger • fallback handler	AGT
L3	Tool Layer CAPABILITY • REGISTRY	tool registry • metadata • capability desc. • pricing rules • permissions • I/O schema • reliability history • reputation • audit status	TLR
L4	Compute Layer INFERENCE • EXECUTION	model providers • inference providers • GPU / CPU networks • execution environments • cost accounting • performance metrics	CPU
L5	Verification Layer PROOF • ATTESTATION	execution logs • proof hashes • verifier attestations • oracle inputs • commitments • reproducibility checks • dispute evidence • proof aggregation	
L6	Settlement Layer PAYMENT • REPUTATION	smart contracts • escrow • milestone payments • usage fees • tool royalties • verifier rewards • slashing • dispute resolution • reputation changes	STL
L7	Governance Layer EVOLUTION • STANDARDS	parameter governance • registry governance • verifier governance • dispute governance • grant allocation • protocol upgrades • community proposals	GOV

◆ Human intent originates here. ◆ Verification proves here. Layers L2-L4 & L6-L7 are protocol substrate.

§ 06 · THE SHAPE OF AN INTENT'S LIFE

Intent Lifecycle.

Declare. Bind. Route. Execute. Prove. Settle. Remember.
Seven stations — each producing structured evidence
the next station can verify.

06 / INTENT LIFECYCLE

Seven stations.

FIG. 4
AGENT PATH

An intent travels from human language to durable memory. Each station both consumes and produces a verifiable artifact, so the agent path from declaration to settlement is reconstructable end-to-end.

Path topology: ● Intent Point → ◆ Proof Ring (verification gate) → ⊙ Settled into the user's Intent Ledger.

§ 07 · WHO BUILDS THE WORLD

Ecosystem Roles.

OM World is not a company. It is a constellation of roles — eight seats around a shared protocol, each one indispensable, none of them dominant.

07 / ECOSYSTEM ROLES

Eight seats. One protocol.

FIG. 5
ROLE ORBIT

§ 08 • THE CORE RULE

If it cannot be proven, it did not happen.

Verification does not require every private detail to be public. It requires that every economically or procedurally important claim carries sufficient evidence — visible to whoever has the right to look.

08 / VERIFICATION MODEL

Proof, by category.

FIG. 6
PROOF MATRIX

Different intent types require different proof levels. The protocol does not prescribe a single proof type; it requires that the originator's mandate specify which proofs are acceptable, and that no settlement complete without them.

PROOF TYPE	BEST FOR	TRUST ASSUMPTION
On-chain transaction	Payments, transfers, on-chain state changes	Native – chain consensus
Signed execution log	Agent action records, tool invocation history	Signer accountability
Tool output hash	Content, code, research artifacts	Hash collision resistance
Verifier attestation	Subjective or fuzzy outcomes	Staked verifier set
Oracle attestation	External world data, prices, events	Oracle network
Zero-knowledge proof	Private computation, selective disclosure	Cryptographic soundness
Reproducible computation	Deterministic pipelines, audits	Reproducer set
Human arbitration	Subjective outcomes, dispute escalation	Juror selection · staking

PROOF REQUIREMENTS

A content-generation intent may only need a hash of the final artifact. A procurement intent may need order confirmation, price evidence, and delivery proof. A financial execution intent requires state-transition evidence and risk logs. A governance intent requires vote records and quorum proof.

PRIVACY POSTURE

Sensitive user data is never exposed by default. OM World supports private inputs with public commitments, selective disclosure, encrypted records, off-chain storage with on-chain hashes, and zero-knowledge proofs where appropriate. Public is a choice, not a default.

§ 09 · VALUE FOLLOWS CONTRIBUTION

Economic Model.

OM World is an open economy. Value flows to participants who help fulfill intentions — tool creators, agent operators, compute providers, verifiers, capital providers, and the protocol commons.

09 / ECONOMIC MODEL

Value flow.

FIG. 7
SETTLEMENT GRAPH

A user pays to have an intent fulfilled. That payment is routed by protocol settlement to everyone who contributed to the outcome. Shares are illustrative only — actual allocations depend on the mandate, the tools used, and protocol parameters.

§ 10 · TOKENS, IF AND WHEN

Token Utility.

Not finalized. No token design is fixed in this Genesis draft. A token, if introduced, must serve protocol function, not speculation.

10 / TOKEN UTILITY · NOT FINALIZED

Function before symbol.

REVIEWED FOR
V0.1 ONLY

— STATUS NOTE —

No token design is finalized in this Genesis draft. A token, if introduced, must serve protocol function, not speculation. The final token model — if any — will be reviewed for legal, economic, security, and governance risk before any launch. This page lists candidate utilities, not commitments.

CANDIDATE UTILITIES

01

Payment

Settlement medium for protocol services.

02

Staking

Bond for verifiers, tools, agents.

03

Governance

Participation in upgrade decisions.

04

Incentives

Reward distribution for contributors.

05

Registry Curation

Curate tool / verifier registries.

06

Dispute Bonding

Bonds posted to escalate disputes.

07

Grants

Ecosystem grant allocation.

08

Settlement

Compute & execution fee settlement.

§ 11 · PROGRESSIVE DECENTRALIZATION

Governance.

OM World must not be controlled by a single company or closed team. Governance is designed as a sequence — slow on values, deliberate on execution, hardened against capture.

11 / GOVERNANCE

From Genesis to DAO.

FIG. 8
GOVERNANCE LADDER

Governance evolves in five stages. Each stage hands more authority to the people building, using, and verifying the protocol — but no stage exists to ship a token, satisfy a deadline, or unlock liquidity.

Principles: transparent · accountable · upgradeable · capture-resistant · contributor-aware · user-sovereign · technically grounded · slow on values, fast on execution.

§ 12 · CONCRETE INTENTS

Initial Use Cases.

OM World begins narrow and verifiable. These six categories share one property: they have unambiguous proof shapes, and their outcomes are clearly auditable.

12 / INITIAL USE CASES

Six intent categories.

FIG. 9
USE CASE CARDS

§ 13 · HOW THE WORLD IS BUILT

Roadmap.

Five phases, each with deliverables and exit criteria.
The roadmap is a contract with the community — not
a sales pitch.

13 / ROADMAP

Five phases.

FIG. 10
PROTOCOL EVOLUTION

Each phase ships specifications, code, or research — and ends when stated exit criteria are met. Phases overlap; the roadmap describes a sequence of completions, not a calendar.

PHASE	PHASE 0 Genesis	PHASE 1 Spec	PHASE 2 MVP	PHASE 3 Testnet	PHASE 4 Open Economy
DELIVERABLES	□ Project identity □ Manifesto □ Litepaper v0.1 □ GitHub org □ Visual system □ Founding contributors	□ Intent Schema v0.1 □ Mandate v0.1 □ Execution Proof v0.1 □ Tool Registry v0.1 □ Verifier Role v0.1 □ Contributor framework	□ Intent submission UX □ Tool registry prototype □ Agent routing □ Execution log format □ Proof hash generation □ Public explorer	□ Contract registry □ Verifier staking □ Tool creator onboarding □ Agent execution records □ On-chain settlement □ Dispute experiment	□ Multi-agent execution □ Multi-tool marketplace □ Reputation system □ Governance modules □ Grants program □ SDKs · partnerships
EXIT CRITERIA	Public manifesto + first 30 contributors.	All five v0.1 specs reviewed & merged.	An end-to-end intent runs against the prototype.	3+ tools / 3+ verifiers on testnet, with dispute trial.	External developers shipping production intents.

§ 14 · WHAT WE DO NOT YET KNOW

Open Questions.

OM World is early. These questions are unsettled — by design. They are an invitation to builders, researchers, and contributors, not a confession of weakness.

14 / OPEN QUESTIONS

Ten unresolved problems.

V0.1 / OPEN
FOR CONTRIBUTION

Every honest protocol document carries a list of what it does not yet know. These are ours. If you have an answer worth defending, open an issue, write a spec, ship a prototype — and tell us.

Q.01 How should intents be structured without limiting human expression?	Q.02 Which parts of execution must be on-chain, off-chain, private, or public?
Q.03 How should subjective outcomes be verified?	Q.04 How can agent decisions be explainable without exposing sensitive data?
Q.05 How should tool creators be rewarded — and bad tools penalized?	Q.06 How can governance avoid capture by any single actor or coalition?
Q.07 How should privacy and verification be balanced across intent types?	Q.08 How can the protocol support both human users and autonomous agents?
Q.09 What is the minimum viable proof for each intent category?	Q.10 How do disputes resolve fairly when proof is partial or contested?

Human intention
should not be owned
by platforms,
auctioned by
advertisers,
or executed by black
boxes.

A new world requires **new laws**.

AI is the engine. Crypto is the law.
Humanity owns its intentions.

One Mind, **One World**.
